The forecasts of the past – the unimaginable future

Prediction is very difficult, especially if it is about the future.

N. Bohr, Physics Nobel Price, 1922

"I have traveled the length and breadth of this country and talked with the best people, and I can assure you that **data processing is a fad that won't last out the year.**"

— The editor in charge of business books for Prentice Hall, 1957

The forecasts of the past – the unimaginable future

Water

IAHR Africa Online Summer School, 2-12 October 2022
I. Popescu @IHE Delft

- Pressures on water resources
- Consequences of climate change
- Need for conservation and sustainability of water resources
- Need for better information and predictions - to understand and to manage water resources

IAHR.org

Water

IAHR Africa Online Summer School, 2-12 October 2022
I. Popescu @IHE Delft

- Need for better information and predictions - to understand and to manage water resources
 - water-related decisions are difficult to test on large-scale experiments, hence the importance of **computer-based modelling**
 - control of water resources must be based on **optimal solutions**
 - management of water needs a lot of **data and information** from various sources

→ need for Computer-based modelling,
Information and Communication Technology (ICT) tools

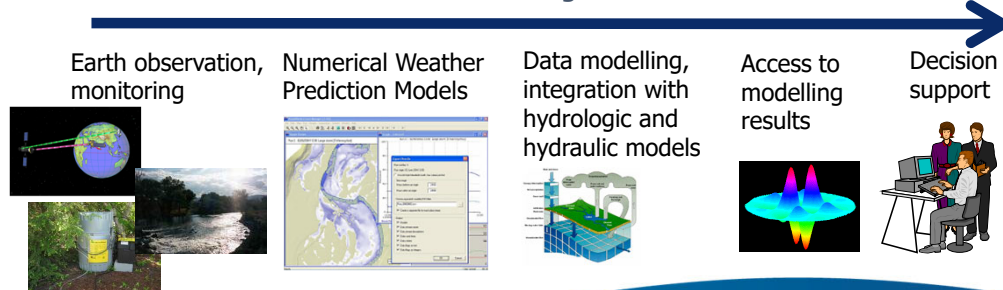

IAHR.org

Hydroinformatics

- modelling, information and communication technology, computer sciences applied to *problems of aquatic environment with the purpose of proper management*
- Flow of information

Data → Models → Knowledge → Decisions

Hydroinformatics research

"I have traveled the length and breadth of this country and talked with the best people, and I can assure you that data processing is a fact that won't last out the year."
— The editor in charge of business books for Prentice Hall, 1957

Data

- Data from:
 - Sensor networks
 - Remote sensing
 - Historical records
- Diverse data models
- Standardization
- From data poor to data rich environments

Models

- Application specific expertise !
- Generic modelling issues:
 - Calibration
 - Sensitivity and Uncertainty analysis
 - Coupling of models
 - Model building (data-driven models)
- Multiple model runs that require more computational power (HPC, Clouds)

DSSs

- Multiple objectives of water systems:
 - Optimisation
 - Multi Criteria Analyses
- Many stakeholders:
 - Collaborative modelling and decision making
 - Web and mobile phone applications
 - Citizens' observatories
- Mix of social and technical data

Examples of using modelling in water-related issues

- Projects
- MSc studies

Data and Decision support

- Decision makers are effective if they
 - seek safe and reliable information
 - acknowledge incompleteness of information
 - depend on a variety of information streams
 - **respect opinions of stakeholders**
 - assess the consequences of possible decisions with models
 - use principles of systems analysis and optimisation
 - generate alternatives – assess them – choose the best one
- There are no tools that make decisions, they only support them

Project IWAVE (2012-2014 IAEA funded)

IAHR Africa Online Summer School, 2-12 October 2022
I. Popescu @IHE Delft

IWAVE- IAEA funded capacity building project
IHE component
Hydrological Information Sharing (HISP)

- Water-related data collected and managed by different agencies
- Proposal: Web-based Spatial Data Infrastructure (SDI) for data sharing
- Agencies maintain control over their datasets and determine conditions for sharing

MSc: Optimisation of Filling of a New Reservoir

Work of Khalid Hasaballah (2012)

- Problem: How to fill a new reservoir such that downstream reservoir is minimum impacted in energy production
- Objective
 - Model-Based Optimization of Downstream Impact During Filling of a New Reservoir
- Case Study: Mandaya and Roseires Reservoirs on the Blue Nile River

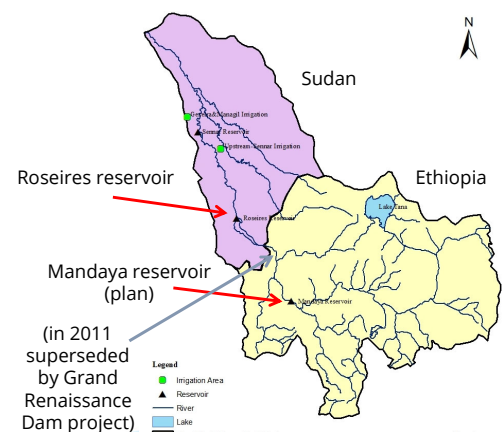

IHE DELFT
Institute for Water Education
under the auspices of UNESCO
IAHR.org

MSc: Optimisation of Filling of a New Reservoir

Work of Khalid Hasaballah (2012)

- Problem:
 - The first 2 years of filling the Mandaya Reservoir leads to reduction of hydropower production within the Sudanese dams
- Research question:
 - What is the optimal (compromise) filling strategy of the upstream Mandaya Reservoir for:
 - Maximum power generated at Mandaya Reservoir during the filling period?
 - Minimum impact on power generation at Roseires Reservoir downstream

IHE DELFT
Institute for Water Education
under the auspices of UNESCO
IAHR.org

MSc: Optimisation of Filling of a New Reservoir

IAHR Africa Online Summer School, 2-12 October 2022
I. Popescu @IHE Delft

• Solution approach and results

- The computational tools are coupled models of MIKE BASIN with MATLAB
- Used the Multi-Objective Optimization (MOO) by randomized search (NSGA-II algorithm) with 2 objective functions:
 - Maximization of Roseires power generation (first 2 years)
 - Maximization of Mandaya power generation (first 5 years)
 - 36 decision variables (monthly control flows from Mandaya distributed over the first 3 years)

- A. Highest weight to Mandaya
- B. Highest weight to Roseires
- C. Equal weight to both objective functions
